GENERAL MOOD DISORDERS

Approximately 20.9 million American adults suffer from general mood disorders.

EVERYDAY LIFE IS A ROLLERCOASTER OF EMOTIONS.

BUT IF YOUR MOOD STARTS TO HAVE AN IMPACT ON YOUR DAILY ACTIVITIES AND IN YOUR SOCIAL, EDUCATIONAL, AND VOCATIONAL RELATIONSHIPS

YOU MAY BE SUFFERING FROM A MOOD DISORDER.
What is general mood disorder?

Mood disorders are characterized by a serious change in mood that cause disruption to life activities.

Major Depressive Disorder

Major depressive disorder is characterized by overall depressed mood.

Mania

Elevated moods are characterized by mania or hypomania.

Bipolar Disorder

The cycling between both depressed and manic moods is a characteristic of bipolar disorder.

Health Condition-Related Mood Disorder

Many medical illnesses like cancer, injuries, or chronic conditions can trigger symptoms of major depression.

Substance-Induced Mood Disorder

Substance-induced mood disorder is characterized by symptoms of depression that are due to the effects of medicine, drug abuse, alcoholism, exposure to toxins, or other forms of treatment.

What are causes of general mood disorder?

Researchers have not found the cause for mood disorders but multiple factors are to be considered.

Biological Factors

The likelihood of living with a mood disorder is influenced by your family history. If a relative is diagnosed with a mood disorder, your present with an increase chance of experiencing one.

Environmental Factors

What you experience plays an important role in your emotional and mental health. Traumatic life events are considered a cause of the onset of mood disorders.

Diagnosing a Mood Disorder

Mood disorders are a real medical disorder.

A Psychiatrist or other Mental Health Professional can diagnose a mood disorder through a complete medical history and psychiatric evaluation.
